PROJECT OVERVIEW

In this proposal, you'll find a breakdown of the expected energy output, projected savings, and environmental benefits of integrating Janta Power's technology into your operations. If you have any questions, feel free to reach out to me directly. We look forward to helping you power the future.

Janta Power proposes to install an array of solar towers at [Address](#) in order to generate electricity to power the location. This installation will produce, on average, [X kilowatts](#) of electricity for your immediate consumption or to store and use later. **System details of the solar tower have been outlined below.**

X KW
System Size

25+ Yrs
Lifespan

X Sq. Ft
Land Required

X Sq. Ft
Land Conserved
(Compared to traditional solar systems)

FINANCIAL BREAKDOWN

The table below details the expected lifetime savings of your solar system.

25-Year Utility Savings	\$60,640
Approximate "Break-Even" Time Period	10 Years
Janta Power's Capacity Factor	24% (17% for Traditional Solar)
Annual Energy Production	22,224 kWh
Annual Return on Investment	10%

The savings estimate does **not account for electricity price escalation or net metering credits.*

Janta Power Comparative Analysis (2025):

System Costs:

Name	Price	QTY	Subtotal
System	\$2.6	10,000W	\$26,000.00
Tax			\$0.00
Subtotal			\$26,000.00
Total			\$26,000.00

**While many solar companies show depreciation as a net price reduction, our proposal doesn't include depreciation as it's purely a tax benefit, not a component of the direct out-of-pocket cost.*

Permissions and Details:

For this project, we will obtain all required permits from both municipal agencies and the utility company. The building permit ensures the installation meets code and does not impact surrounding structures. The utility permit, known as an interconnection permit, grants permission to connect your system to the grid and confirms the system is safe and code-compliant. Our solar towers are designed to meet all current local, state, and national regulations, and we can adjust designs as needed for local code requirements.

Interconnection permits commonly ask for the following:

- Location of the utility meter
- Electrical panel(s)
- Proposed PV array and other landmarks
- Number of solar panels/inverters with manufacturer and model
- Capacity ratings for the inverter and PV panels

Site Overview:

To complete the design and validate final output potential, we recommend a follow-up site inspection to assess soil conditions (for ground-mounted units), accessibility, electrical interconnection points, and regional weather patterns. This ensures your system is optimized for maximum performance, long-term reliability, and return on investment.

Customer Approval:

Once you've reviewed the terms above, sign this proposal to indicate your approval. An installation contract will then be created and sent to you for final approval and signature.

Signature:

A handwritten signature in black ink that reads "Adam Boudissa". The signature is stylized with a large, flowing 'A' and 'B'.
